

Module 2

Perception and Motivation

PERCEPTION

MEANING OF PERCEPTION:

- Perception can be defined as the process which involves seeing, receiving, selecting, organising, interpreting and giving meaning to the environment.
- In simple sense, perception means perceiving, i.e., giving meaning to the environment around us.
- We look at something, but perceive it differently.
- For example, looking at a painting, some may perceive it as beautiful, the others as ugly.

DEFINITION OF PERCEPTION:

- Perception includes all those processes by which an individual receives information about the environment by seeing, hearing, feeling, tasting, and smelling.
- Perception is affected by following three elements:
 - the objects or events being perceived,
 - the environment in which perception occurs, and
 - the individual who perceives.
- The above definition contains all these three elements of perception.

PERCEPTUAL PROCESS:

- Perceptual process is a process of receiving and interpreting stimuli.
- Stimuli mean things that produce reactions in living things.
- Perception goes beyond influencing individual behaviour.
- Perception affects several areas of organisation.
- Managers manage perceptual process effectively.
- Perceptual process involves the following series of steps:

PERCEPTUAL PROCESS...

1) RECEIVING STIMULI:

- The perceptual process starts with the reception of stimuli.
- Stimuli are received from various sources.
- Through the five sensory organs(Eyes, Ears, Nose, Tongue and Skin), we see objects, hear sounds, smell, taste and touch things.
- Stimuli may be internal or external.
- **External stimuli** include light waves, sound waves, mechanical energy, chemical energy and objects that one can smell and taste.

PERCEPTUAL PROCESS...

- **Internal stimuli** include energy generated by muscles, food passing through the digestive system, and the secreting behaviour of glands which influences hormones.
- Though stimuli may be external or internal to the organism, but our focus is on external stimuli.

2) SELECTING STIMULI/SELECTIVE ATTENTION:

- All stimuli which are received are not accepted.
- Some stimuli are noticed and some are screened out.
- A girl needs a radio to be tuned on while she is reading or writing.

PERCEPTUAL PROCESS...

- She happily concentrates on her lessons even though film songs come out from the radio.
- A nurse working in a post-operative care might ignore the smell of recently disinfected instrument.
- But a small flashing red light on the nurse station is immediately noticed because it signals that a patient's vital organs are failing.
- **The process of filtering information by our sense organs is called selecting stimuli.**

PERCEPTUAL PROCESS...

FACTORS INFLUENCING SELECTION OF STIMULI:

- Factors influencing the selection of stimuli may be external or internal to the body.

A. EXTERNAL FACTORS:

- External factors influencing selection of stimuli are described as follows:
 - i) Nature
 - ii) Location
 - iii) Colour
 - iv) Size
 - v) Contrast
 - vi) Movement
 - vii) Repetition
 - viii) Novelty and Familiarity

PERCEPTUAL PROCESS...

i) Nature:

- By nature we mean whether the object is visual or auditory and whether it involves pictures, people or animals.
- Pictures attract more attention than words, picture with human being attracts attention more than objects only.

ii) Location:

- The best location for attracting attention is directly in front of the eyes and in the centre of a page.
- In a news paper or magazine, when the centre is not possible, the upper portion is favourable than lower portion and left hand side receives more attention than right.

iii) Colour:

- Colour is used to attract attention.
- Colour can be used to emphasize the attractive features of a product.
- High technology products such as cameras are usually produced in black finish although some are marketed with less serious colours.
- Some products, such as cars, come in variety of colours.
- Colour has a psychological impact on an individual.
- It is well-known that some colours act as stimulant and others act as depressant.

PERCEPTUAL PROCESS...

iv) Size

- Generally, larger size objects attract more attention than do smaller ones.
- The maintenance engineering staff may pay more attention to a big machine than to a smaller one, even though the smaller one costs as much and is as important to the operation.
- A 6 foot 4 inch, 90 K.G supervisor may receive more attention from his subordinates than a 5 foot 3 inch, 40 K.G supervisor.
- A full page advertisement attracts more attention than a few lines advertisement in the news paper.

PERCEPTUAL PROCESS...

v) Contrast:

- The contrast principle states that external stimuli which stand out against the background, or which are not what people are expecting, will receive their attention.
- The following figure illustrates this perceptual principle, i.e., contrast.

PERCEPTUAL PROCESS...

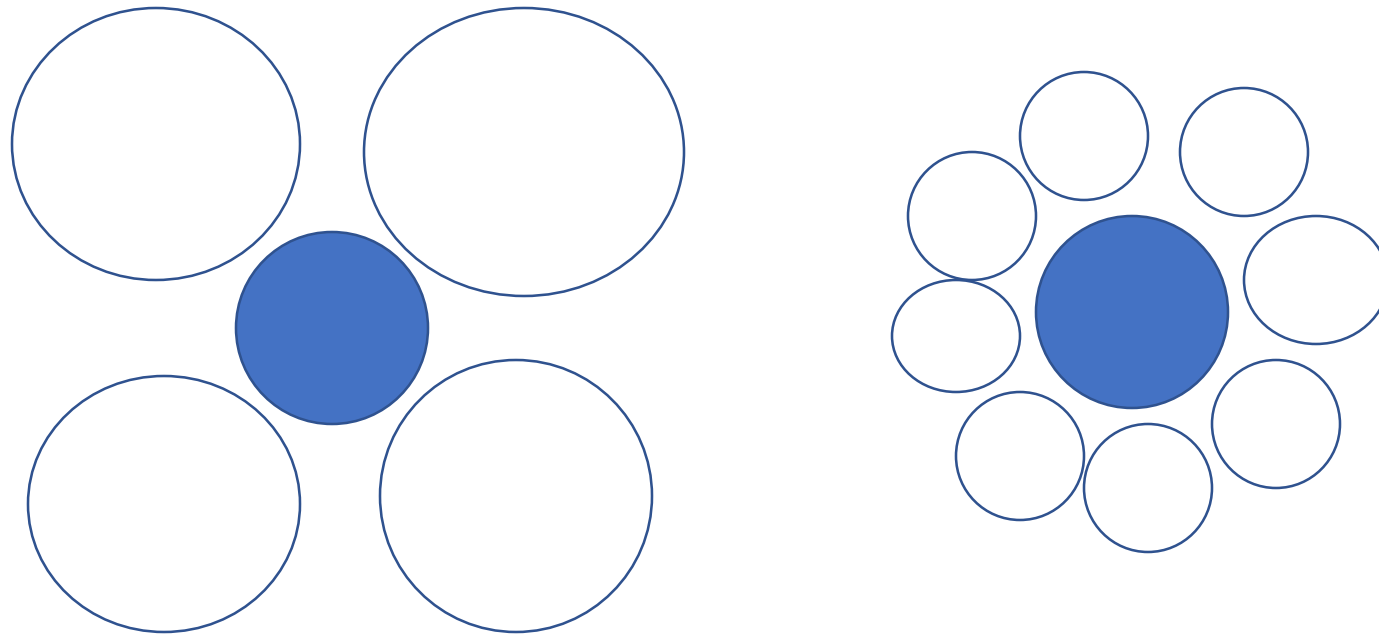

Figure : The Contrast Principle of Perception

PERCEPTUAL PROCESS...

- The black circle on the right appears larger than the one on the left because of the background circles.
- In fact both black circles are of the same size.
- In a similar manner, plant safety signs which have black lettering on a yellow background or white lettering on a red background are attention drawers.
- Training managers utilise this factor in organising training programmes in places far away from work places to create contrast atmosphere.

PERCEPTUAL PROCESS...

vi) Movement:

- The principle of motion states that a moving object receives more attention than an object that is stationary.
- In a work environment, the attention of a workman will be focused more on a conveyor belt than on paintings on walls or illumination.
- Advertisers capitalise on this principle by creating signs which incorporate moving parts.

PERCEPTUAL PROCESS...

vii) Repetition:

- The repetition principle states that a repeated external stimulus is more attention drawing than a non-repetitive one.
- The same advertisement of a product flashed daily on television is based on the principle of repetition.
- This principle also explains why supervisors have to give directions to workers over and over again for even simple tasks.

viii) Novelty and Familiarity:

- The novelty and familiarity principle states that either a novel or a familiar external situation can serve as an attention getter.
- New objects in familiar setting or familiar objects in new setting will draw the attention of the perceiver.
- Job rotation is an example of this principle.
- Changing workers' job from time-to-time will tend to increase the attention they give to the task.
- Anything novel attracts attention fast, for example, humour, animation, and unusual graphics in an advertisement stand out and are noticed.

PERCEPTUAL PROCESS...

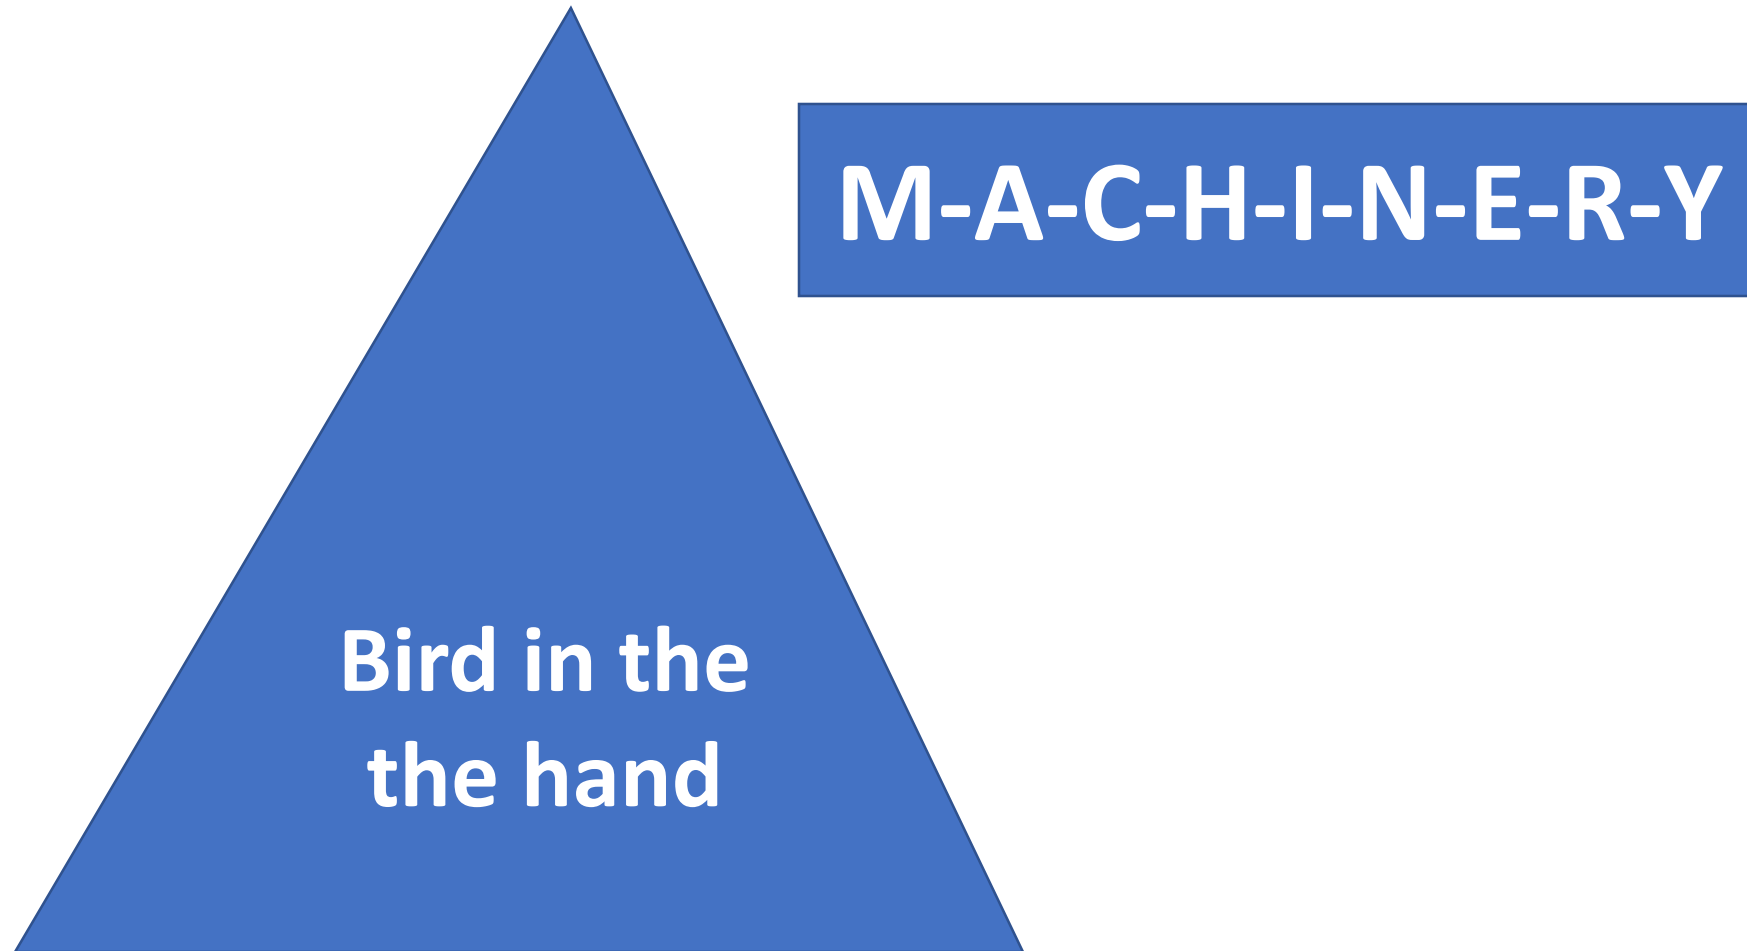

B. INTERNAL FACTORS INFLUENCING SELECTION OF STIMULI:

- Internal factors influencing selection of stimuli are discussed as follows:

i) Learning:

- Learning has considerable influence on perception.
- It creates expectancy in people.
- People tend to perceive what they want to perceive.
- The following illustrations have been used by psychologists to demonstrate the impact of learning on perception.

PERCEPTUAL PROCESS...

- Figure: The Learning Principle of Perception

PERCEPTUAL PROCESS...

- One tends to read the sentence, because of prior learning, in the triangle as 'Bird in the hand.'
- It takes a few seconds for the reader to realise that there is an extra 'the' in this sentence.
- This illustration shows that learning creates expectancy in an individual and expectancy makes him see what he wants to see.
- Another illustration is typical.
- The individual is likely to read the word in the rectangle as 'Mac-Hinery' instead of 'machinery'.
- In organisations, managers' and employees' past experiences and learning strongly influence their perceptions.

PERCEPTUAL PROCESS...

- For example, executives are influenced by their functional backgrounds while making decisions.
- They might perceive their own areas of expertise while solving problems.
- It is also likely that the decision makers can 'rise above' their own experiences and limitations and solve problems effectively.

PERCEPTUAL PROCESS...

ii) Psychological Needs:

- Needs play a significant role in perceptual selectivity.
- Unreal things often look real because of deprived needs.
- A thirsty person in a desert, for instance, gets the illusion of water when seeing sand from a distance.
- In one experiment, people who were kept hungry for sometime were shown pictures and were asked to describe what they saw in them.
- Most of them reported more food items in such perceptions.

PERCEPTUAL PROCESS...

iii) Age Difference:

- Older, senior executives complain about the inability of the new, young ones to take tough decisions concerning terminating people, or paying attention to details and paper work.
- The young managers, in turn, complain about the 'old guards' resisting change and using paper and rules as ends in themselves.
- Different perceptions of old and young executives are due to their differences in age.

PERCEPTUAL PROCESS...

iv) Interest:

- Perception is influenced by the interests of the perceiver.
- An architect will notice many details of buildings though he passes by once.
- Someone else may pass the same building everyday for years without ever observing such details.

v) Ambivalence:

- Another factor for selection of stimuli is ambivalence which means mixed feelings about a situation.
- For example, a young man may be ambivalent about his fiancée's virtues and shortcomings.

PERCEPTUAL PROCESS...

- She may be an attractive, charming and poised woman with whom he likes to be seen.
- The young man wants to remain a success in his circle, so he represses the awareness of her negative qualities and selectively perceives only those qualities which are favourable.

PERCEPTUAL PROCESS...

3) PERCEPTUAL ORGANISATION:

- Perceptual organisation is the process by which people group stimuli or data into some recognisable patterns, so as to assign some meaning to them. Thus, organising the bits of information into a meaningful whole is called organisation.
- For example, most people have a mental picture of an object made of wood and having four legs, a seat, a back and armrests; an image of chair.
- When people actually see an object having these characteristics, they are able to organise the in coming information into a meaningful whole and recognise the object to be a chair.

PERCEPTUAL PROCESS...

- Following are the some of the important **ways through which selected stimuli or data are organised:**

i) Grouping:

- Grouping principle is demonstrated when objects of similar shape, size or colour tend to be grouped together.
- For example, in an organisation who wear white collars may be perceived a common group.
- All workers coming from the same place may be perceived as similar on the basis of proximity.

PERCEPTUAL PROCESS...

- Similarly, several workers working on a machine are perceived to be one group and the group as a whole is held responsible for any failure in the machine.
- The following figure demonstrates the proximity principle.
- The eight circles in the figure are seen as pairs of two, three, or four depending their nearness to one another.

0000 0000
000 00 000
00 00 00 00

Figure: Principle of Proximity

PERCEPTUAL PROCESS...

ii) Closure:

- When people face with incomplete information, they tend to fill the gaps themselves to make it more meaningful.
- They may do it on the basis of their experience, intuition or past data.
- **The tendency to form a complete message from an incomplete one is known as closure.**
- In an organisation, a manager facing a complex decision may be able to develop a fairly accurate understanding of the issues even though some details may be lacking.
- Based on experience and imagination, the manager can fill in the missing pieces needed to make a decision.

PERCEPTUAL PROCESS...

- The following figures illustrate the closure principle.

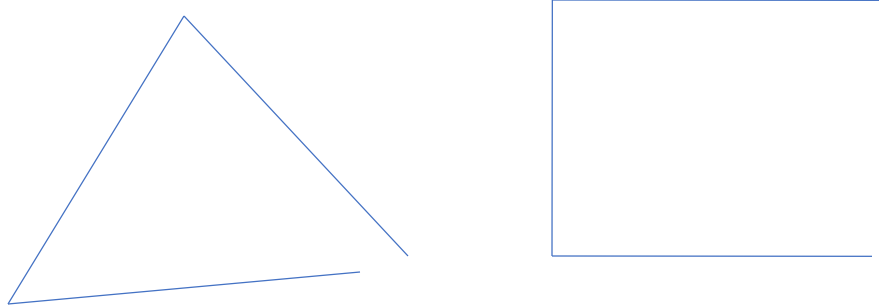

Figure: The Principle of Closure

PERCEPTUAL PROCESS...

iii) **Simplicity:**

- When people find themselves overloaded with information, they try to simplify it to make more meaningful and understandable.
- In this process, what they do is to subtract less important information and concentrate on important ones only.

4) INTERPRETATION:

- The data collected and organised remain meaningless for the perceiver till these are assigned meanings.
- Assigning meaning to data is called interpretation.
- The interpretation process is the most important element in the entire process of perception.

PERCEPTUAL PROCESS...

- **The factors influence interpretation of data in organisations are:**

i) Halo Effect:

- Drawing a general impression about an individual based on a single characteristic is called halo effect.
- It refers to the tendency of a perceiver in terms of good and bad and assigning all good qualities to one who is liked and all bad qualities to another who is disliked.

PERCEPTUAL PROCESS...

- For example, a professor awarding more marks to a well-liked students.
- The professor, who likes the student, wants him to do well in the examination and his perception about the student's examination is influenced by what he wants to see.
- In organisations, superiors evaluate subordinates on certain dimensions may assume that some one who is good in one dimension must also be good at other things and rate the person highly.

PERCEPTUAL PROCESS...

ii) **Attribution:**

- Attribution refers to explaining human behaviour in terms of cause and effect.
- The evaluation and reaction to others behaviour may be heavily influenced by their perception.
- For example, if a prosperous worker does overtime on any day, it is perceived that he has done it in the interest of the organisation.
- If a poor worker also does the same, the action of behaviour is perceived as being for the money.

PERCEPTUAL PROCESS...

iii) Stereotyping:

- When individuals are judged on the basis of the characteristics of the group to which they belong, is called stereotyping.
- Some examples of common stereotypes are women, doctors, professors, artists, executives, workers and the like.
- The older workers can not learn new skills.
- Overweight people lack discipline.
- Japanese are nationalistic, and workers are anti-management are some other examples of stereotypes.
- Stereotyping does not give in-depth truth.

PERCEPTUAL PROCESS...

iv) Perceptual Set

- Previously held beliefs about objects influence an individual's perceptions of similar objects called perceptual set.

For example,

- A manager may have developed general beliefs that workers are lazy and they want to gain whatever is possible from the organisation without giving of their best to it.

PERCEPTUAL PROCESS...

v) Projection:

- Under certain conditions, people tend to see in another person traits that they themselves possess.
- That is, they project their own feelings, tendencies, motives in to their judgement of others.
- For example, a person who is not energetic may see others as lazy, one who is dishonest may perceive others as dishonest and who are afraid of interpret others as fearful.

PERCEPTUAL PROCESS...

vi) Perceiver:

- The perceiver's motives, interests, attitudes, past experience and expectations are important factors which affect interpretation.

5) THE PROCESS OF CHECKING:

- The perceiver tends to check whether his perceptions are right or wrong.
- One way of checking is to put a series of questions to himself and the answers will confirm whether his perception is correct or incorrect.
- Another way is to check with others.

PERCEPTUAL PROCESS...

6) PROCESS OF REACTING:

- The last phase of perceptual process is reaction.
- The perceiver will indulge in some action in relation to his perception.
- The action depends whether the perception is favourable or unfavourable:
- The action is positive when the perception is favourable and action is negative when the perception is unfavourable.

APPLICATIONS OF PERCEPTION IN OB:

- The practical applications of perception are as follows:
 1. EMPLOYMENT INTERVIEW
 2. PERFORMANCE APPRAISAL
 3. EMPLOYEE'S EFFORT
 4. EMPLOYEE'S LOYALTY
 5. IMPRESSION MANAGEMENT

1) EMPLOYMENT INTERVIEW:

- In the organisation, the perception principle is applied during the employment interview.
- At this stage, the candidate is asked a number of questions and on the basis of answer to such questions, different interviewers try to see different things in the same candidate and arrive at different perceptions about the candidate.
- Then the final decision is taken whether he is given an opportunity to work there or not.

2) PERFORMANCE APPRAISAL:

- In an organisation, perception is applied for 'performance appraisal'.
- An employee's future is closely tied to his performance appraisal.
- Promotion, pay-rise and continuation of employment are among the most obvious outcomes of performance appraisal.
- Employee's performance appraisal is very much dependent on perceptual process.

3) EMPLOYEE'S EFFORT:

- Perception is also used for measuring 'Employee's Effort'.
- An individual's future is usually not dependant on performance alone.
- In many organisations the level of an employee's effort is given high importance.
- Just as the teachers' efforts are considered by taking in to account how hard they try in a course as well as how they perform in conducting examination.
- An assessment of an individual's effort is a subjective judgement which is susceptible to perceptual bias.

PERCEPTIONS AND OB...

4) EMPLOYEE'S LOYALTY:

- In an organisation, the next application of perception is 'Employee's loyalty'.
- Sometimes managers make judgements about the employees whether they are loyal to the organisation.
- Some managers may term those workers 'disloyal' who are applying for jobs elsewhere.
- An employee who questions top management's decisions may be labelled; 'disloyal' by the management but a fighter by the colleagues.

- Similarly, 'a whistle blower' who reports unethical practices by the management to outsiders may act out of loyalty to the organisation, but is perceived as trouble maker by the management.

5) IMPRESSION MANAGEMENT/SELF PRESENTATION:

- The purpose of impression management is to regulate the perceptions of others about us.
- We mostly try to present ourselves in a socially acceptable way in order to impress others.

PERCEPTIONS AND OB...

- The employees try to present themselves in an acceptable way to their superiors in order
 - to be rated high in the performance appraisal
 - or
 - to be considered for continuation of employment or
 - to get promotion
 - or
 - to get enhancement in salary and the like.

MOTIVATION

MEANING OF MOTIVATION:

- ‘Motivation’ is derived from Latin word “movere” which means “to move”.
- Motivation is the process which starts with a physiological or psychological need that activates behaviour which is aimed at a goal.
- In simple terms, motivation is the set of forces that influence people to behave in certain ways.

DEFINITION:

- According to **Stephen P. Robbins**, “Motivation is the willingness to exert high levels of effort towards organisational goals, conditioned by the effort and ability to satisfy some individual needs”.

IMPORTANCE OF MOTIVATION:

- i) Motivated employees perform allotted tasks. They look for better ways to do a job.
- ii) A motivated employee is generally more quality oriented.
 - This is true whether a manager spending extra time on data collection and analysis for a report, or a clerk taking extra care when filing important documents.
 - Motivation helps a manager to make his employees quality oriented.

IMPORTANCE OF MOTIVATION...

iii) Highly motivated workers are more productive.

- The high productivity of Japanese workers makes them to produce an automobile with fewer workers than elsewhere.

iv) Any technology needs motivated employees to adopt it successfully.

- The secret behind the success of ISRO has been its employees who are both capable and willing to use the advanced technology to reach the goals.

IMPORTANCE OF MOTIVATION...

v) Every organisation requires human resources.

- Human resources have following three behavioural dimensions which are very important for the organisation.
- People must be attracted not only to join the organisation but also to remain in it.
- People must perform tasks for which they are hired and in a dependable manner.
- People must go beyond this dependable role performance and engage in some form of creative and innovative behaviour at work.

So to make an organisation effective, motivation plays a very important role.

NATURE OF MOTIVATION:

Nature of motivation is discussed briefly as follows:

1)Motivation is a psychological concept:

- A person's activation depends upon his felt needs and expectation.
- The process of motivation is mainly concerned with needs, desires, expectations, confidence and satisfaction. These are all psychological concepts.
- The psychology of every individual is different from others, so it is difficult to determine which incentives will motivate a person towards desired goals.

NATURE OF MOTIVATION...

2)Motivation is a continuous process:

- Human wants are unlimited. With the satisfaction of one want, another want preferably of higher order is created.
- Thus, new wants emerge when the present wants are satisfied.
- Further, all the wants can not be satisfied at the same time. Wants are to be satisfied one after another continuously.
- Hence, motivation is also a continuous and unending process.

NATURE OF MOTIVATION...

3)Motivation is Dynamic and Situational:

- The motives and behaviour are all dynamic in nature.
- What motivates a person today may not motivate him tomorrow.
- His needs, drives, expectations, value judgement remain changing and hence the process of motivation is highly dynamic and motivation is also situational, .
- In a set of organisational climate, structure, physical facilities and nature of work, one may be highly motivated, but any change in them may have an adverse effect on his motivation.

NATURE OF MOTIVATION...

4)Motivation is a Goal-oriented process:

- Proper and effective motivation inspires people to contribute their best towards the realisation of their individual goals as well as organisational goals.

5)Motivation is influenced by social and Cultural Norms:

- Social and cultural values, customs and attributes play important role in motivation.
- If society attaches respect, recognition and acceptance to a job or organisation, the individual is motivated to that job or organisation.

NATURE OF MOTIVATION...

6)Motivation is not easily observed phenomenon:

- The action of a person can be observed and then we try to interpret the actions which constitute his behaviour in terms of his underlying motives and satisfaction.

In this interpretation, there can be a wide error of judgement.

— — —

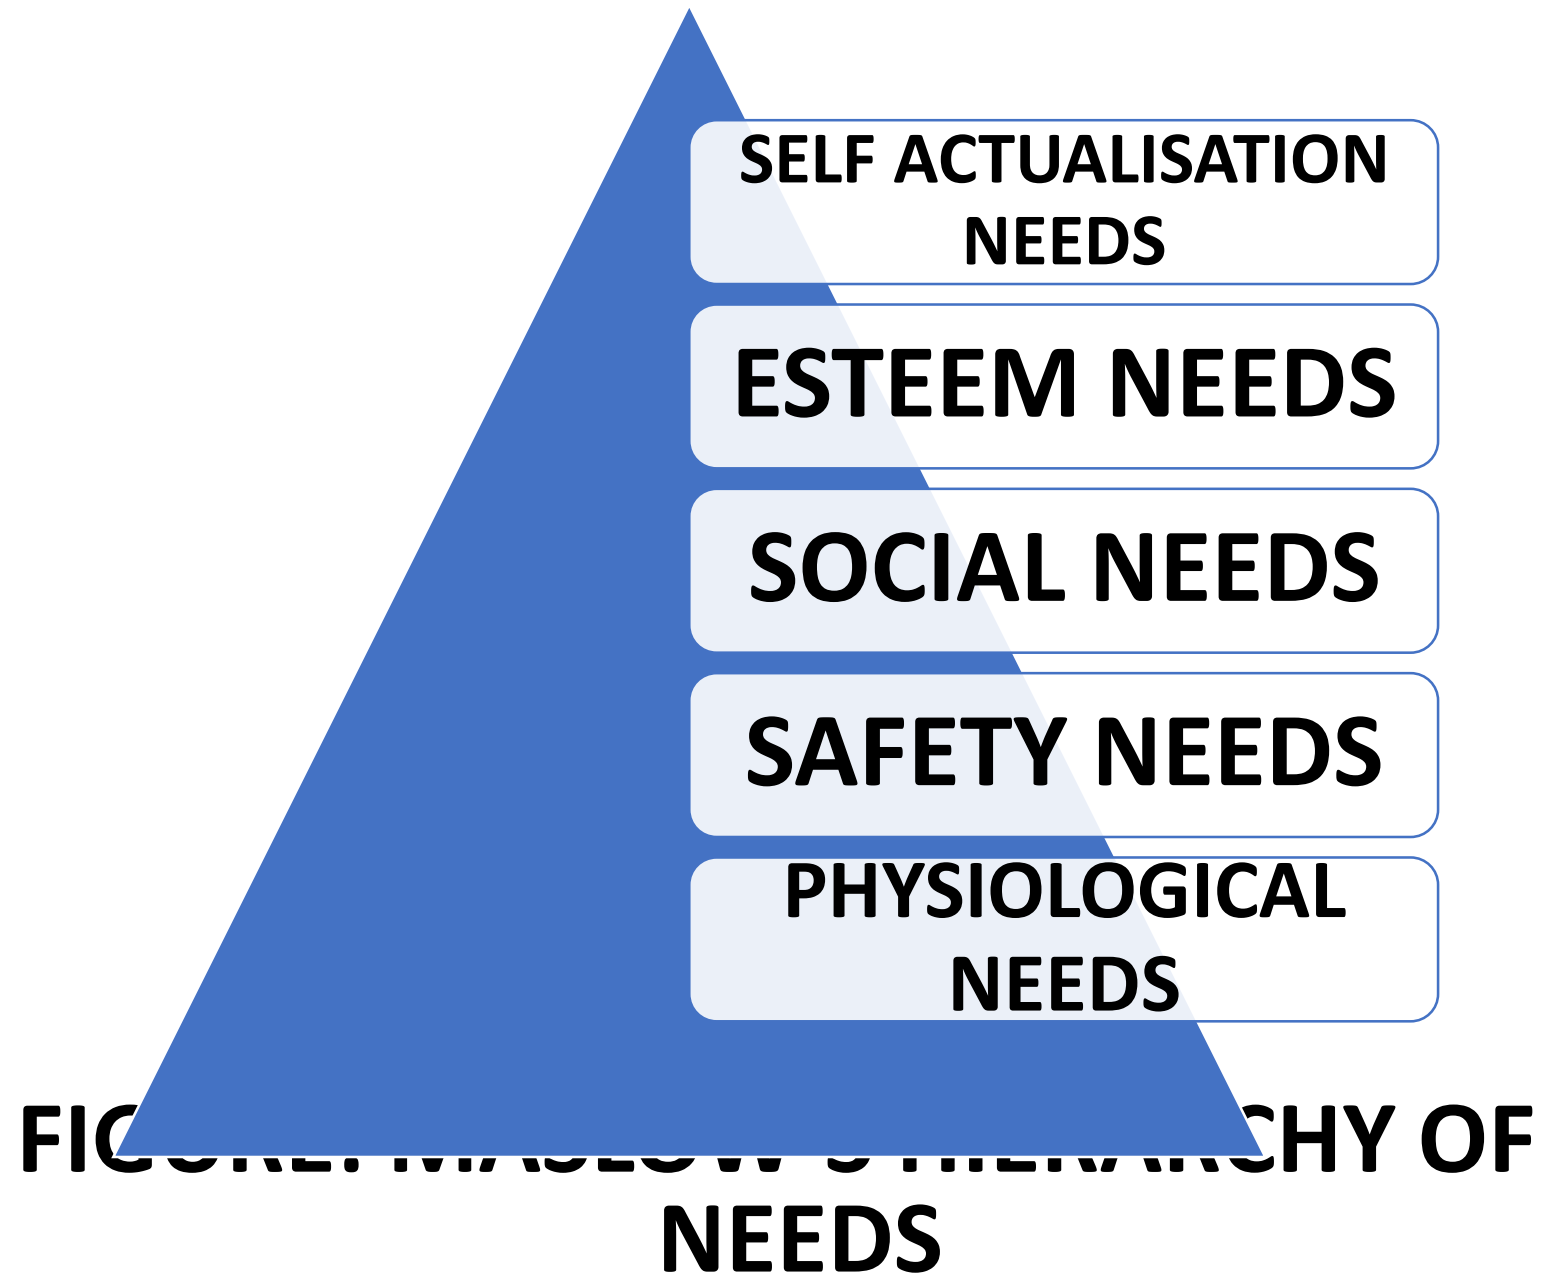

THEORIES OF MOTIVATION:

1) MASLOW'S NEED HIERARCHY THEORY:

- This theory is propounded by Abraham Harold Maslow.
- It is the simplest and most widely discussed theory of motivation.
- Maslow's theory of motivation is based on human needs.
- According to this theory, only unsatisfied needs can influence behaviour, satisfied needs do not act as motivators.

MASLOW'S NEED HIERARCHY THEORY...

- Since needs are many, they are arranged in an order of importance or hierarchy, from the basic to complex.
- The person advances to the next level of hierarchy, or from the basic to complex, only when the lower level need is at least minimally satisfied.
- Maslow has presented the hierarchy of needs in the following order.

MASLOW'S NEED HIERARCHY THEORY...

I) PHYSIOLOGICAL NEEDS:

- These needs are basic to human life, e.g., food, clothing, shelter, air, water and other necessities of life.
- These needs relate to the survival and maintenance of human life.
- These needs influence tremendously on human behaviour.
- These needs are to be met first at least partly before higher level needs emerge.
- Once physiological needs are satisfied, they no longer motivate the man.

MASLOW'S NEED HIERARCHY THEORY...

II) SAFETY NEEDS:

- Once physiological needs are met, one's attention turns to safety or security needs.
- Economic security and protection from physical dangers such as war, crime, waves, floods, earth quakes, riots and other similar conditions are included in safety needs.
- Meeting these needs requires more money and the individual is prompted to work more.
- These needs become inactive once they are satisfied.

MASLOW'S NEED HIERARCHY THEORY...

III) SOCIAL NEEDS:

- Once the safety needs are met, social needs arise.
- Social needs are those which are related to interaction with other people and may include need for friends, need for belongingness and need to give and receive love.

IV) ESTEEM NEEDS:

- Esteem needs include prestige, recognition, acceptance, status, reputation, and attention.
- Individuals need to be appreciated for what they can do.
- Satisfaction of esteem needs generates self-confidence, strength and capability of being useful in the organisation.
- Inability to fulfill these needs leads to feeling like inferiority, weakness and helplessness.

MASLOW'S NEED HIERARCHY THEORY...

v) SELF ACTUALISATION NEEDS:

- Self actualisation is to become the total kind of person that one wants to become to reach the peak of one's potential.
- Maslow estimated only a few, i.e., less than one percent of the population fulfills the need for self-actualisation.

MASLOW'S NEED HIERARCHY THEORY...

Maslow suggested the following points:

- There are five levels of needs.
- All these needs are arranged in a hierarchy.
- A satisfied need is no longer a need. Once a need is satisfied, it ceases to be a motivating factor.
- Once one level of need is satisfied, the next level of need will emerge as the depressed needs seeking to be satisfied.
- The physiological and safety needs are finite but the needs of higher order are infinite and are likely to be dominant in persons at higher levels in the organisation.
- Maslow suggests that various needs are interdependent and overlapping.

MASLOW'S NEED HIERARCHY THEORY...

- Each higher level need emerges before the lower level need has been completely satisfied.
- Even though a need is satisfied, it will influence the behaviour because of interdependent and overlapping characteristics of needs.

Maslow's theory provides an important explanation for the changing motivation of workers over time.

When a new employee first starts a job, physiological and safety needs are likely to motivate him, later his attention will turn to higher level needs.

2) HERZBERG'S MOTIVATION HYGIENE THEORY:

OR DUAL FACTOR THEORY OR TWO FACTOR THEORY

- Fredrick Herzberg proposed Motivation Hygiene Theory.
- It has been widely accepted by the managers concerned with the problem of human behaviour at work.
- Herzberg conducted a study on 200 accountants and engineers.

MOTIVATION - HYGIENE THEORY...

- He asked these people to describe two important incidents at their jobs:
 - i) When did you feel particularly good about your job ? and
 - ii) When did you feel exceptionally bad about your job?
- He used **Critical Incident Method** for obtaining data.
- The replies of the respondents were consistent.
- The replies the respondents gave when they felt good about their jobs were significantly different from the replies given when they felt bad.

MOTIVATION - HYGIENE THEORY...

- Satisfied needs make an individual search for higher level needs and frustration at one level will push an individual down to lower level needs.
- Factors such as
 - Achievement,
 - Recognition,
 - The work itself,
 - Responsibility,
 - Advancement and
 - Growth are related to job satisfaction which are known as **Motivators**.
- When respondents were asked when they felt good about their work, they attributed the above factors.

MOTIVATION - HYGIENE THEORY...

- On the other hand, when respondents were asked when they were dissatisfied about their work, they attributed the following factors:
 - Company policy and administration
 - Supervision.
 - Work conditions
 - Status,
 - Salary,
 - Security and
 - Interpersonal Relations.
- These factors are known as dissatisfiers, **Hygiene Factors**, and maintenance factors, as they prevent the occurrence of undesirable consequences.

MOTIVATION - HYGIENE THEORY...

- According to Herzberg, satisfaction and dissatisfaction are two separate dimensions.
- Satisfaction is affected by motivators and dissatisfaction is affected by Hygiene Factors. This is the key idea for managers.
- This theory suggests to improve hygiene factors(dissatisfiers) and to provide motivators(satisfiers) for the motivation of the employees.

MOTIVATION - HYGIENE THEORY...

- Motivation can not take place only by improving the hygiene factors in the work environment.
- So, the manager has to improve hygiene factors for removal of dissatisfaction from the minds of employees and to provide motivators to increase satisfaction among the employees.

3)ALDERFER'S ERG THEORY:

- This theory was propounded by **Clay Alderfer**.
- Alderfer's views are the results of questionnaires he gave to over 100 bank employees.
- He suggests following three categories of human needs:

i) NEED FOR EXISTENCE (E):

- The need for existence is the first and foremost need of an individual. This is very fundamental for each and every individual.
- It includes basic physiological needs (hunger and thirst) and protection from physical danger.
- This is equivalent to the physiological need and safety need of Maslow.

ALDERFER'S ERG THEORY:

ii) **NEED FOR RELATEDNESS (R):**

- Once the need for existence is satisfied, another need emerges, i.e., the need for relatedness.
- This is due to the social behaviour and all types of cordial attitude of the individual.
- Alderfer pointed out this type of need is equivalent to the third and fourth need of Maslow, i.e., Social and Esteem needs.

iii) **NEED FOR GROWTH (G):**

- The third type of need that an individual desires is the personal growth along with the organisation.
- This is equivalent to Self-Actualisation Need of Maslow.

DIFERENCE BETWEEN ERG THEORY AND HIERARCHY THEORY:

- Hierarchy Theory points out **five** types of need but ERG theory points out only **three** types.
- Hierarchy theory postulates a rigid step but in ERG theory there is no rigid hierarchy is found. But ERG theory put forwards that more than one need may be operative, e.g., an individual can be working on growth even though existence and relatedness needs are unsatisfied.

DIFERENCE BETWEEN ERG THEORY AND HIERARCHY THEORY...

- Hierarchy theory emphasises that a person will stay at a certain level until that need is satisfied but the ERG theory says that if a higher level need is frustrated, the person will desire to increase a lower level need.

The two dimensions of ERG theory are Frustration and Regression. Frustration at higher level need can lead to regression at lower level need.

THANK

'U'
